

# MPAI Basics

Leonardo Chiariglione

2025/02/12 T15:00 UTC

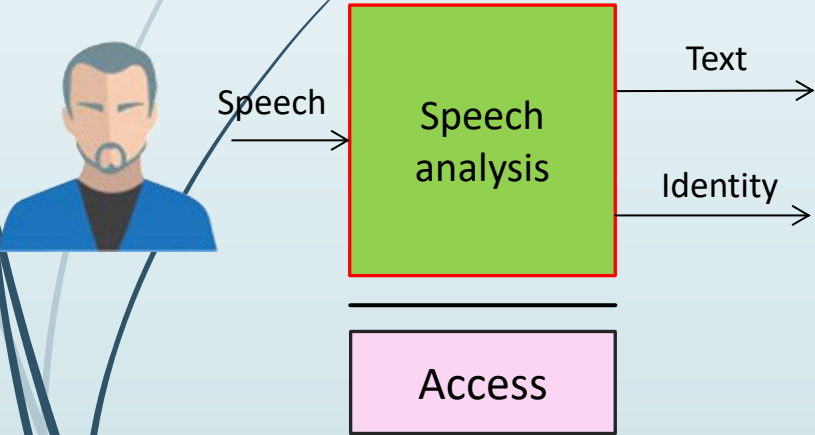

# Who is MPAA

- MPAA – Moving Picture, Audio and Data Coding by Artificial Intelligence is an international, unaffiliated, non-profit association based in Geneva
- With the mission to promote the efficient use of Data by:
  - Developing Technical Specifications for
    - Coding of any type of Data, especially using new technologies such as AI, and
    - Technologies that integrate Data Coding components in ICT systems, and by
  - Bridging the gap between Technical Specifications and their practical use through the development of Intellectual Property Rights Guidelines (“IPR Guidelines”),.
- MPAA operates based on open international collaboration of interested parties supporting the MPAA mission and the means to accomplish it.

# Explainable standards

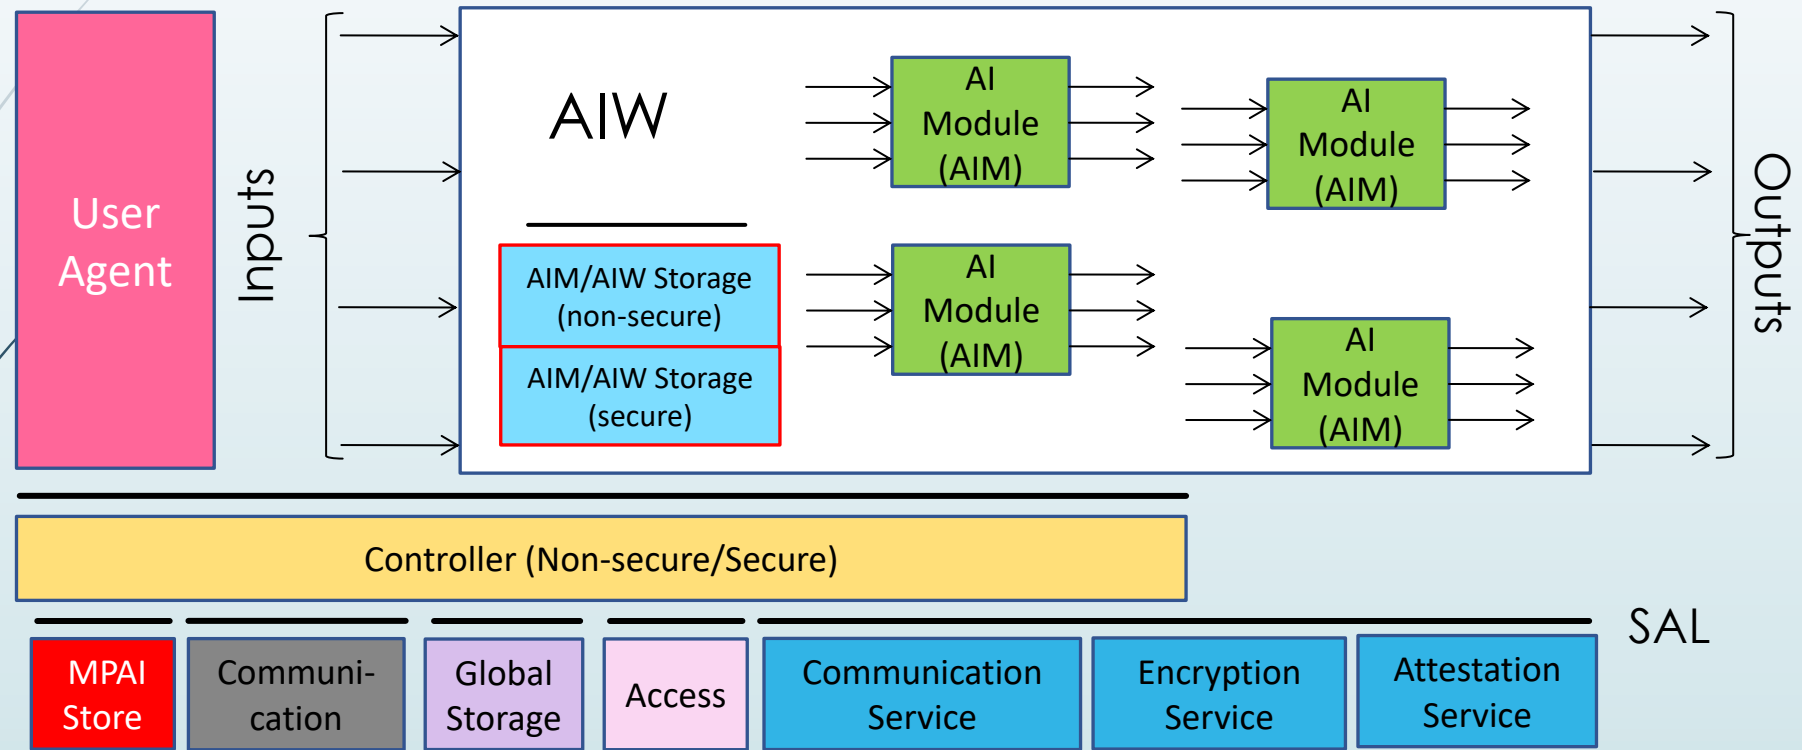

## AI module (AIM)

## AI Workflow (AIW)

# Technical Specification: AI Framework (MPAI-AIF) V2.1

AIF enables dynamic configuration, initialisation, execution, and control of an AIW

# Accessible & timely available standards

**Before** initiating a standard, Active Principal Members **develop & adopt** its Framework Licence (FWL), a licence without *values: \$, %, dates etc.* declaring that the eventual licence will be issued

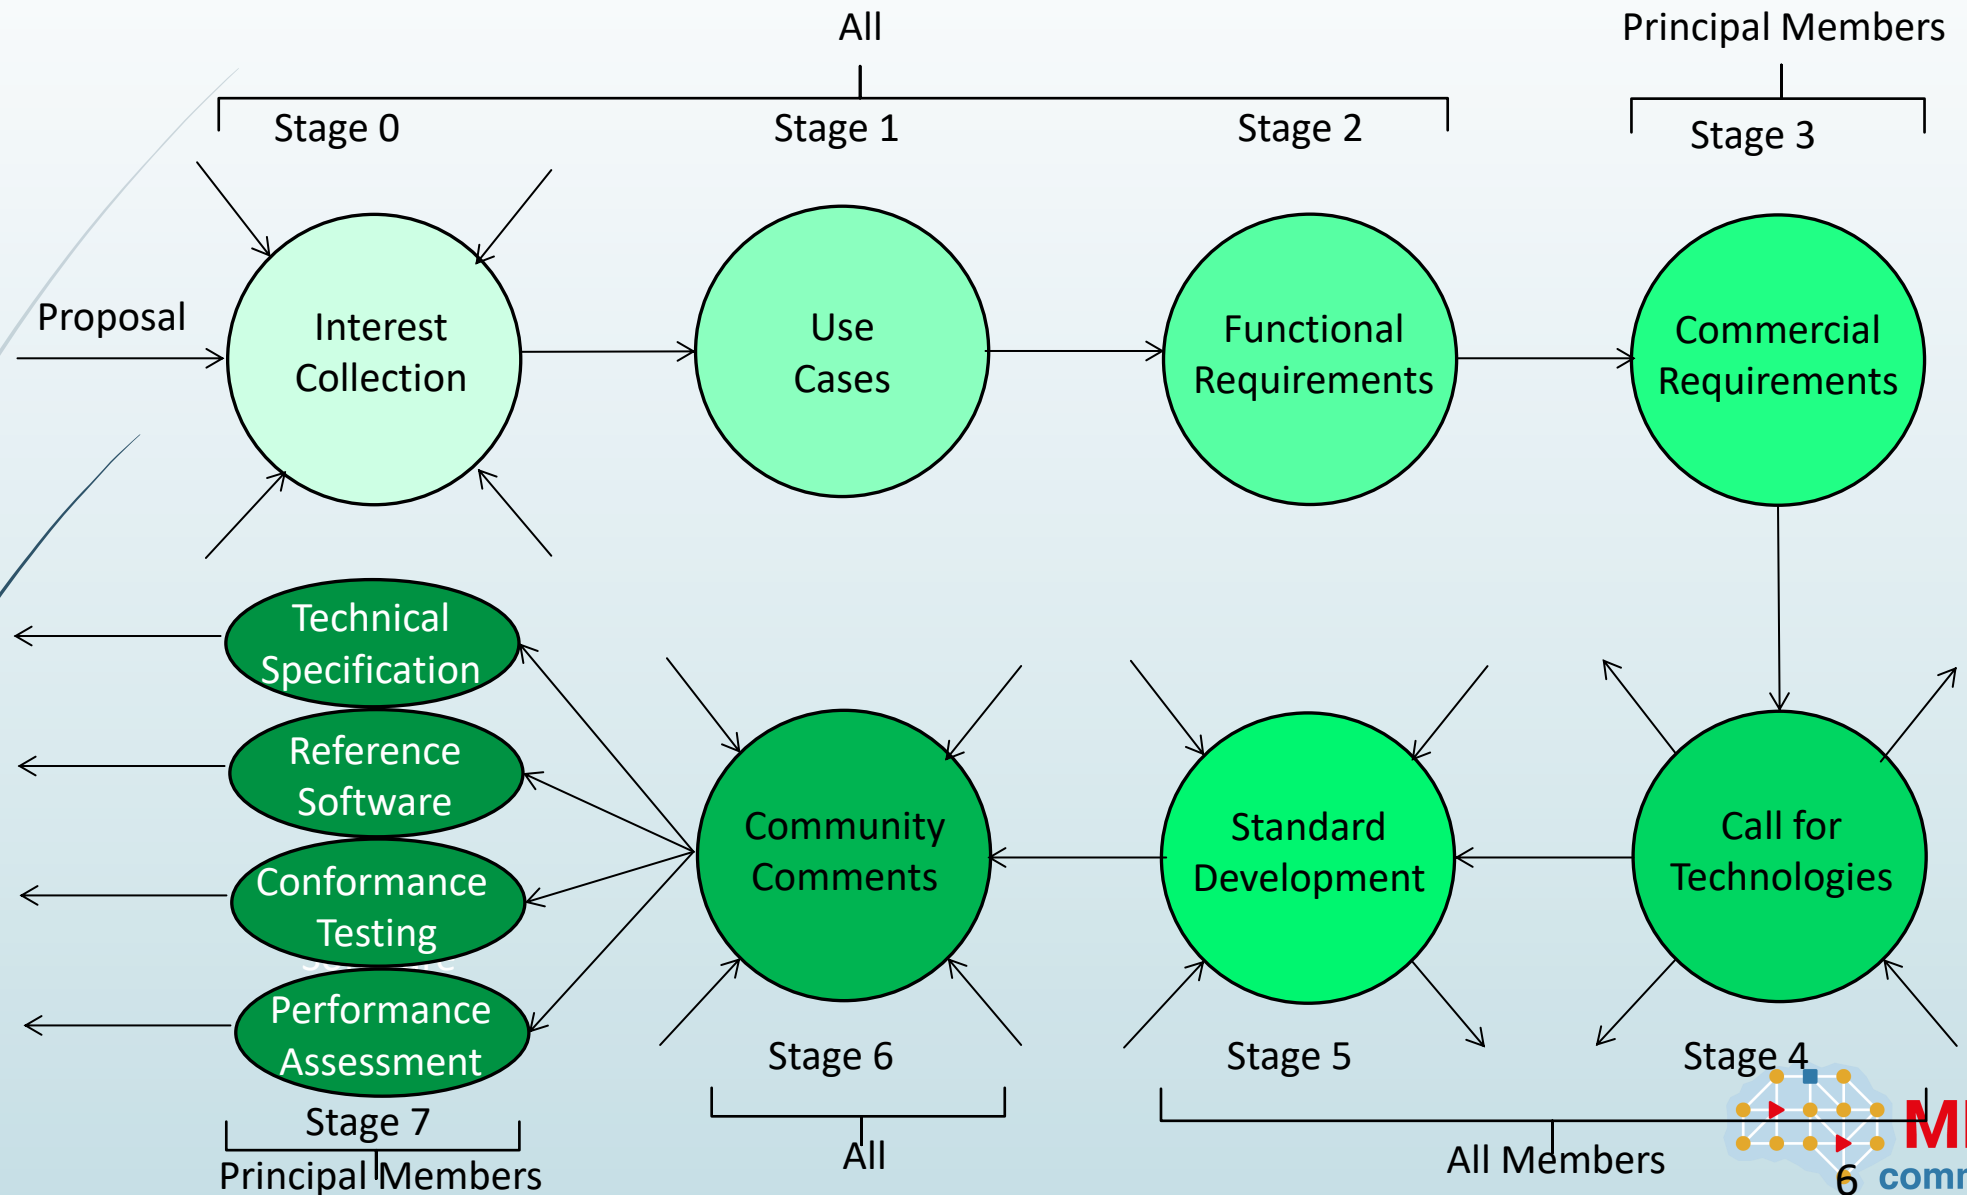

1. Not after products are on the market.
2. At a price comparable with similar standard technologies.

**During** the development, any Member making a contribution **declares** it will make its licence available according to the FWL.

**After** the development, Members holding IP in the standard **select** the preferred patent pool administrator.

# Rigorous standards development process

# The results, so far

Acronym	Name	TS	RS	CT	PA	IEEE
MPAI-AIF	AI Framework	x	x			3301-2024
MPAI-CAE	Context-based Audio Enhancement	x	x	x		(3302-2024 )
MPAI-CAV	Connected Autonomous Vehicle					3307-2024
MPAI-CUI	Compression and Understanding of Financial Data	x	x	x	x	
MPAI-GME	Governance of the MPAI Ecosystem	x				
MPAI-HMC	Human and Machine Communication	x				
MPAI-MMC	Multimodal Conversation	x	x	x		3300-2024
MPAI-MMM	MPAI Metaverse Model	x				3305-2024
MPAI-NNW	Neural Network Watermarking	x	x			3304-2023
MPAI-OSD	Object and Scene Description	x				(3308-2024)
MPAI-PAF	Portable Avatar Format	x				3306-2024
MPAI-PRF	AI Module Profiles	x				
<b>MPAI-SPG</b>	<b>Server-based Predictive Multiplayer Gaming</b>	<b>x</b>	<b>x</b>			
MPAI-TFA	Data Types, Formats and Attributes	x				

# Plans for new and extended standards

Acronym	Name
MPAI-AIH	AI for Health
MPAI-CAE	Context-based Audio Enhancement (6 Degrees of Freedom)
MPAI-CAV	Connected Autonomous Vehicle (Technologies)
MPAI-CUI	Compr. & Underst. of Financial Data (Company Perform. Prediction)
MPAI-EEV	AI-Enhanced Video Coding
MPAI-EVC	End-to-End Video Coding
MPAI-MMC	Multimodal Conversation (Perceptive and Agentic AI)
MPAI-MMM	MPAI Metaverse Model (Integration of Architecture & Technologies)
MPAI-NNW	Neural Network Watermarking (new applications)
MPAI-TFA	Data Types, Formats and Attributes (new data types)
MPAI-XRV	XR Venues

We look forward to working  
**with you**  
in MPAI projects!

# MPAI-SPG MDL

Server-based Predictive Multiplayer Gaming (MPAI-SPG) –  
Mitigation of Data Loss

*Francesco Strada – Politecnico di Torino*

# Online Multiplayer Gaming

# Online Multiplayer Gaming

- Network architectures: **Authoritative Servers vs Peer to Peer**
- Authoritative servers is among the **most widespread**

# Online Multiplayer Gaming - Problems

- The server's game state shared version can be corrupted
  - Data loss
  - Latency
  - Data corruption

# Online Multiplayer Gaming - Solutions

- Several techniques to mitigate/compensate network issues [1]
  - Time Delay - (Server)
  - Time Warp - (Server)
  - Client Prediction - (Client)

[1] L. Shengmei, X. Xiaokun e M. Claypool, «A survey and taxonomy of latency compensation techniques for network computer games,» ACM Computing Surveys (CSUR), pp. 1-34, 2022

# SPG MDL

- Server-Side Prediction (SPG) – Mitigation Data Loss (MDL)
  - Server Side -> guarantees consistency and QoE for all clients
  - Prediction -> AI-based
  - Data Loss -> missing data or delayed data

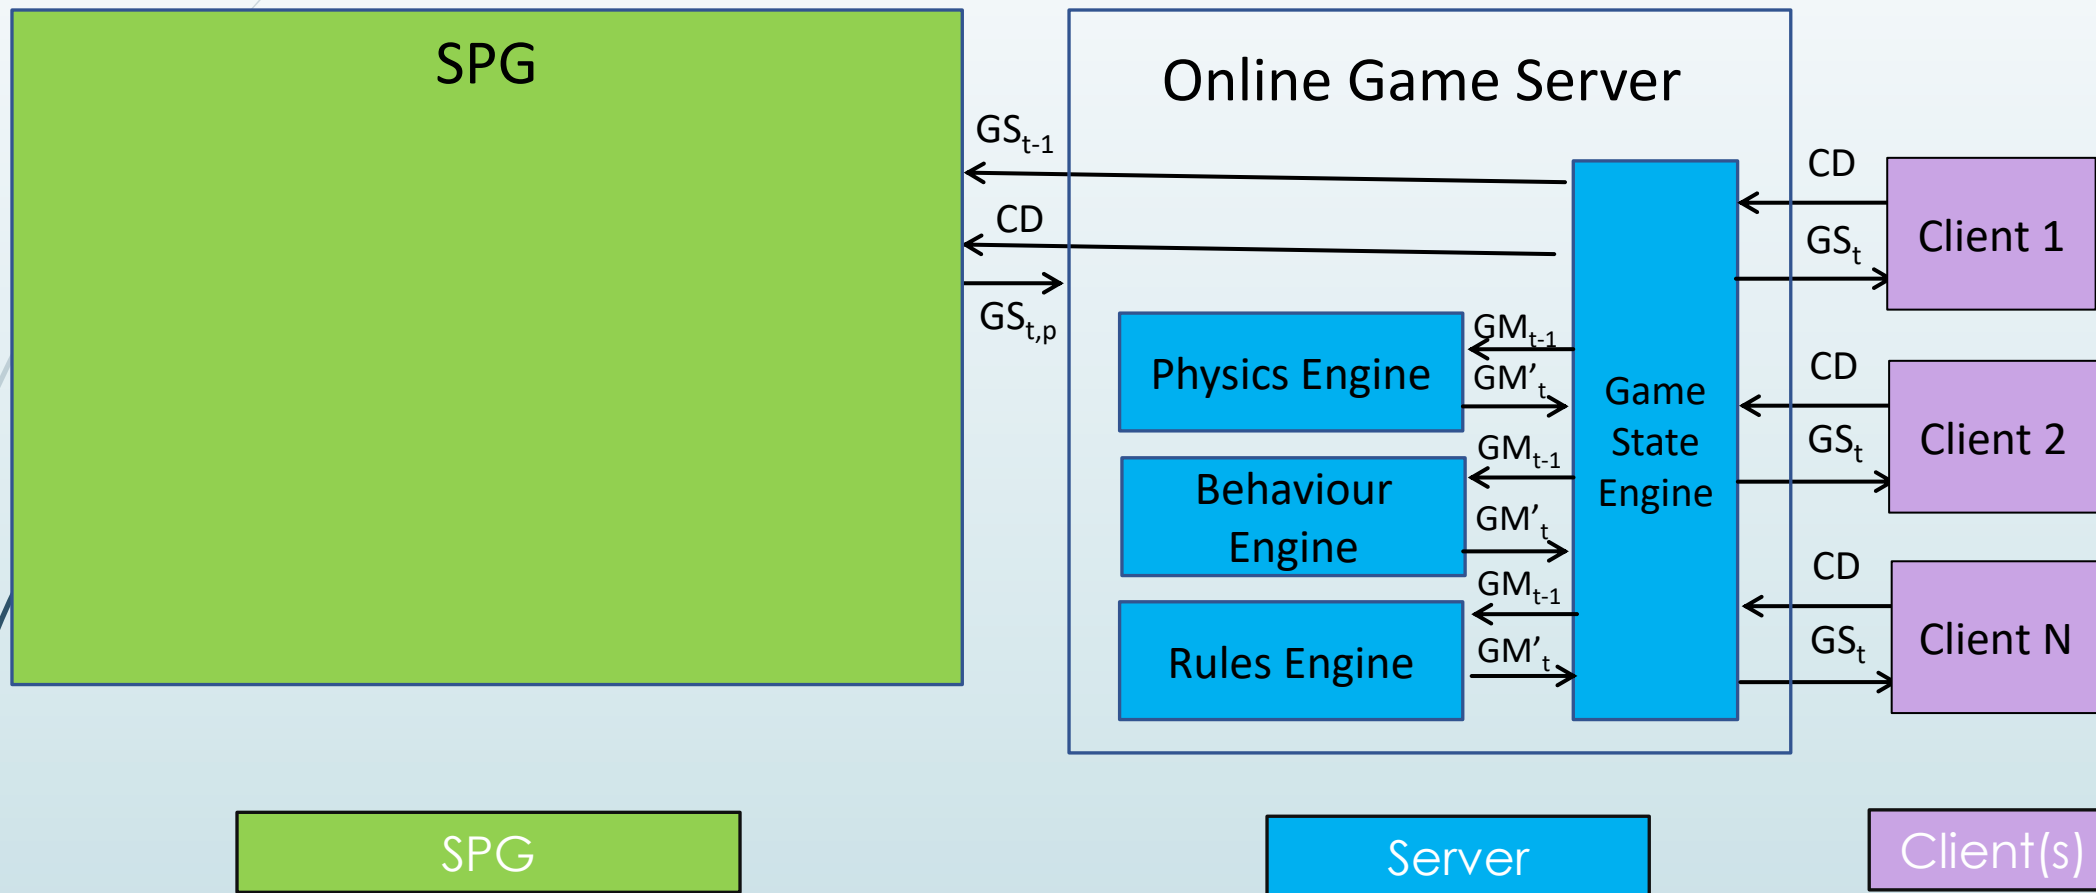

# SPG – Reference Model

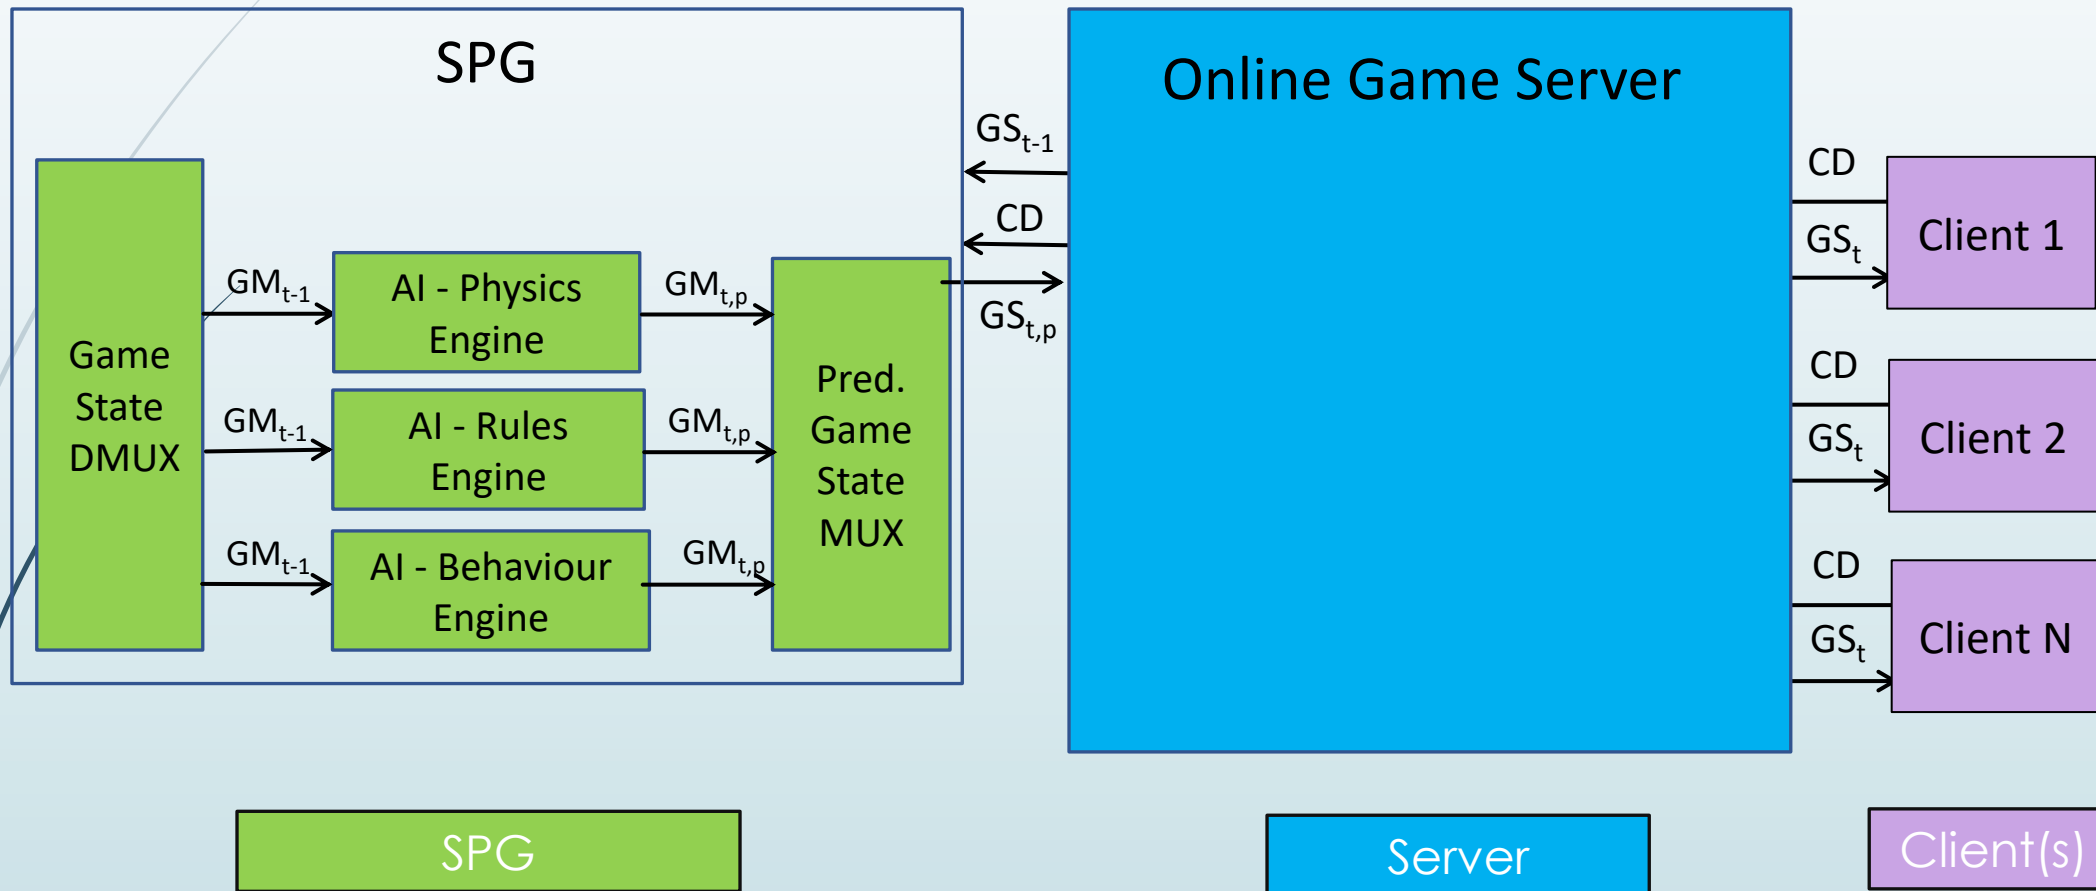

# SPG MDL - Reference Model

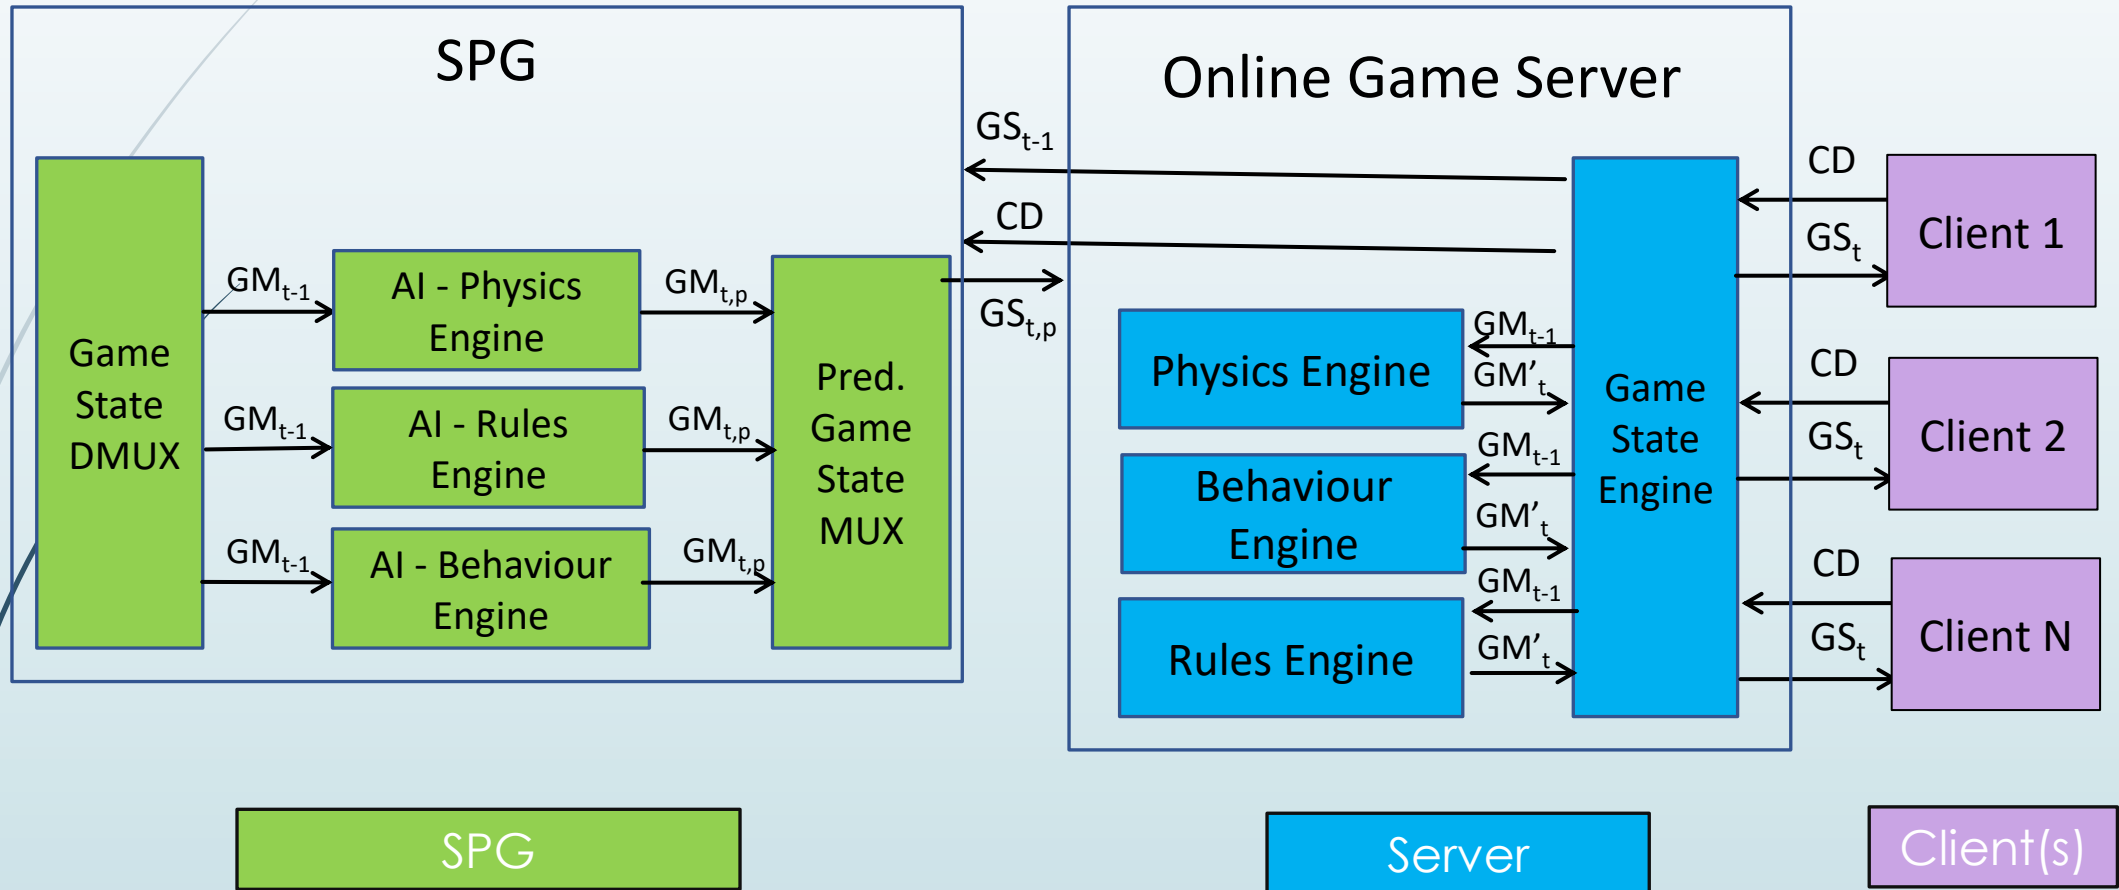

# SPG MDL - Reference Model

# SPG MDL - Reference Model

# SPG MDL - Reference Model

# SPG – Process Guidelines

# SPG MDL - Process Guidelines

- Games are intrinsically **very different from one another** as they have different:
  - Mechanics
  - Entities
  - Rules
- Defining a standard **that fits all** of them is **almost impossible**
- We decided to define a Process which should serve as Guidelines, documenting it in a **Technical Report**

# SPG MDL - Process Guidelines Technical Report

- The process is composed of **10 steps**, where we provide:
  - High Level Guidelines (**WHAT** you should do)
  - Implementation Example (**HOW** we did it)
- The example is provided in the form of a multiplayer **car racing game**

# SPG MDL - Process Guidelines

- 1. **Select** the game
- 2. Define the **Entities** (to enable parameters identification)
- 3. Define the **Game State** and relevant **Entities**
- 4. **Design** training dataset
- 5. **Collect** training dataset
- 6. **Train** prediction models
- 7. **Implement SPG**
- 8. **Evaluate SPG** to select the model yielding the best predictions
- 9. Implement modules which **simulate** the **disturbances**
- 10. Evaluate the SPG enabled **game experience** with human players

# SPG MDL - (1) Select the Game

## Guideline

- SPG can be **applied to any** multiplayer online game (authoritative server).
- SPG must be **embedded** in the game -> having access to the source code is a requirement

## Car Racing Game

- An example game was **developed from scratch**

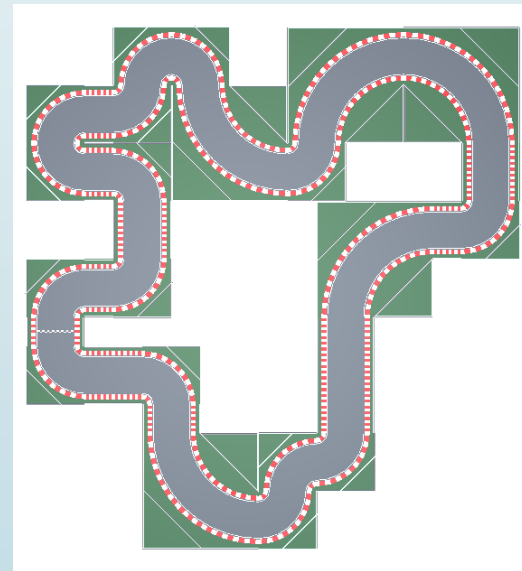

# SPG MDL - (2) Define Entities

## Guideline

- Identify how Entities affect the Game State to single out which of them will benefit from predictions.

## Car Racing Game

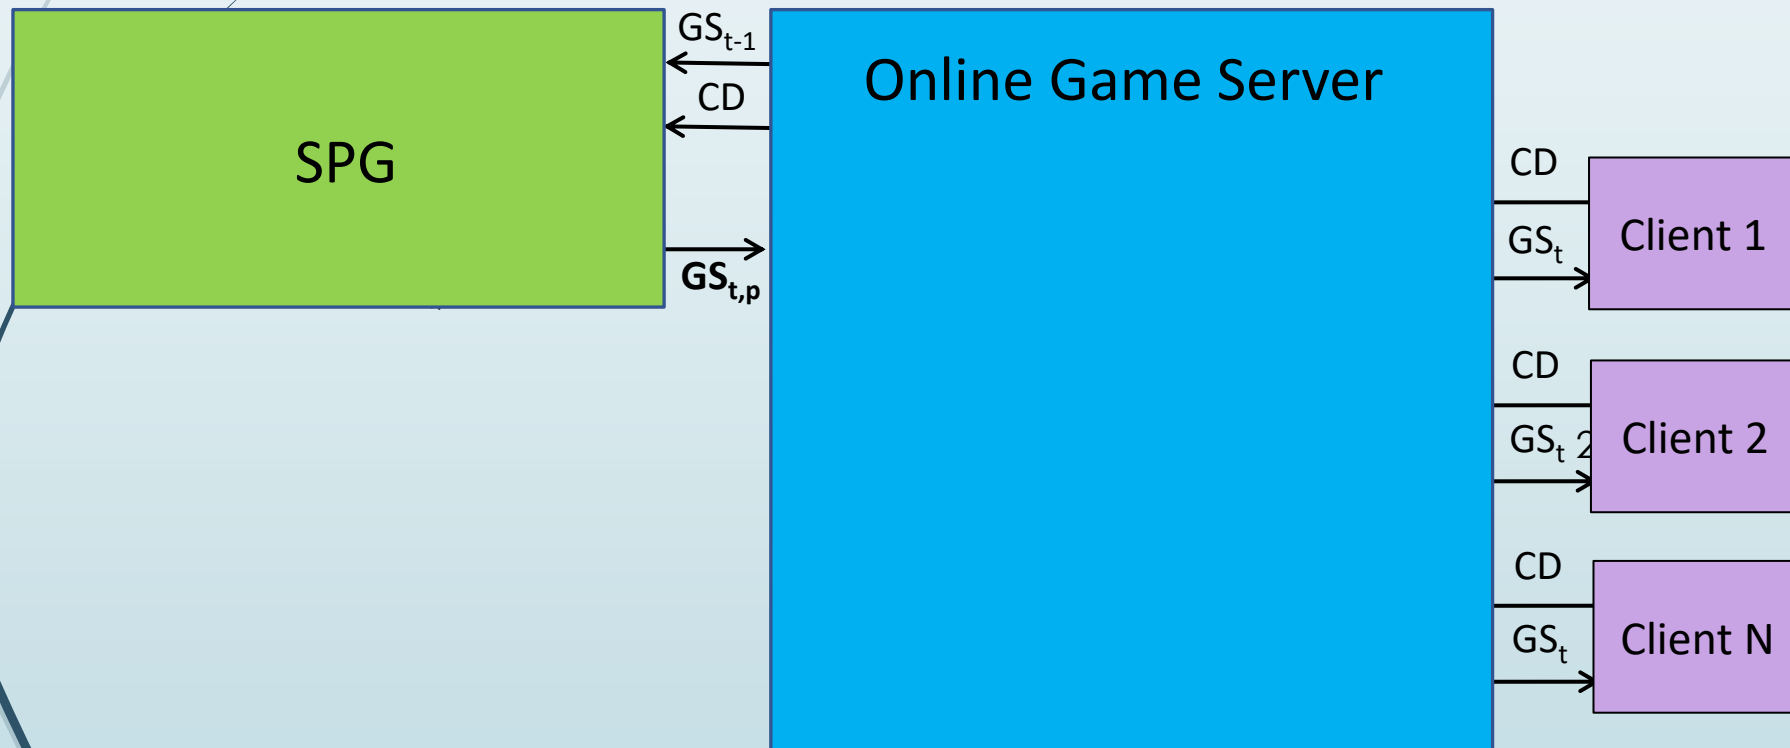

- **Cars** controlled by players racing along the **track**

# SPG MDL - (3) Define Game State

## Guideline

- Identify minimal set of Entities and their properties affecting the Game State
- Achieve a balance between Prediction accuracy and Model complexity

# SPG MDL - (3) Define Game State

## Car Racing Game

- The car's **Spatial Attitude (SA)**: Position, Orientation, Velocity and Acceleration
- Composing each car's SA the entire Game State can be reconstructed

# SPG MDL - (4-5) Training Dataset

## Guideline

- (?) Data available → exploit **existing** dataset
- (?) No available dataset → **create** one
  - **Human** Player → real game sessions (- convenient + accurate)
  - **AI Agent** Player → simulated game (+ convenient - accurate)

# SPG MDL - (4-5) Training Dataset

## Car Racing Game

- Exploited autonomous Agent Players to simulate numerous game sessions and collected 2 million records (50% train, 25% test, 25% validation)
- Each record is a sample containing:
  - Car's SA (entity data)
  - Car's relative position on the tile (environment data)

# SPG MDL - (6) Train Prediction Models

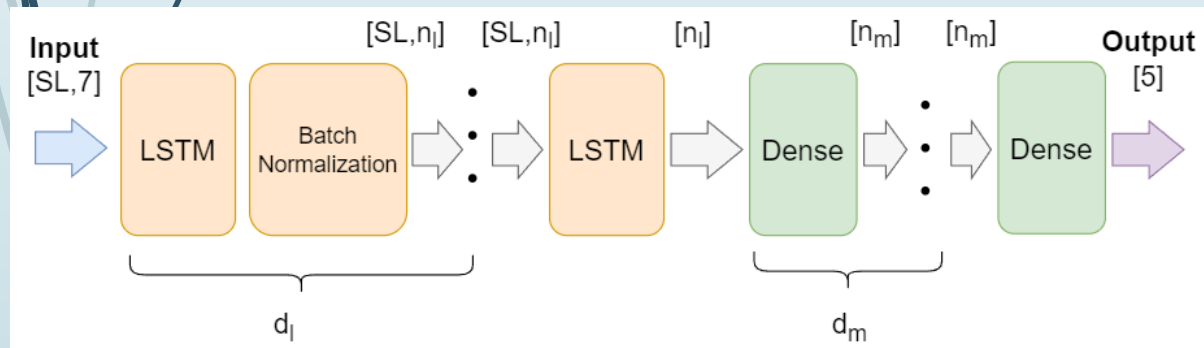

## Guideline

- ▶ Time series prediction -> select a Neural Network model suitable for the task
- ▶ Train several networks exploiting:
  - ▶ Different input vectors
  - ▶ Different hyperparameter
- ▶ Select a subset of the  $n$  (e.g., 4) best networks -> lower mean absolute error

# SPG MDL - (6) Train Prediction Models

## Car Racing Game

- Used a deep LSTM as NN
- Input: vector of  $N$  containing car's SA + environment data from present and past
- Output: car's SA
- Selected a subset of the 4 best

ID	$d_l$	$n_l$	$d_m$	$n_m$	SL	Val MAE
1	3	64	3	64	20	<b>0.579</b>
2	3	256	3	64	20	<b>0.544</b>
3	1	256	0	0	40	<b>0.569</b>
4	3	256	3	64	40	<b>0.453</b>

# SPG MDL - (7-8) Implement and Evaluate SPG

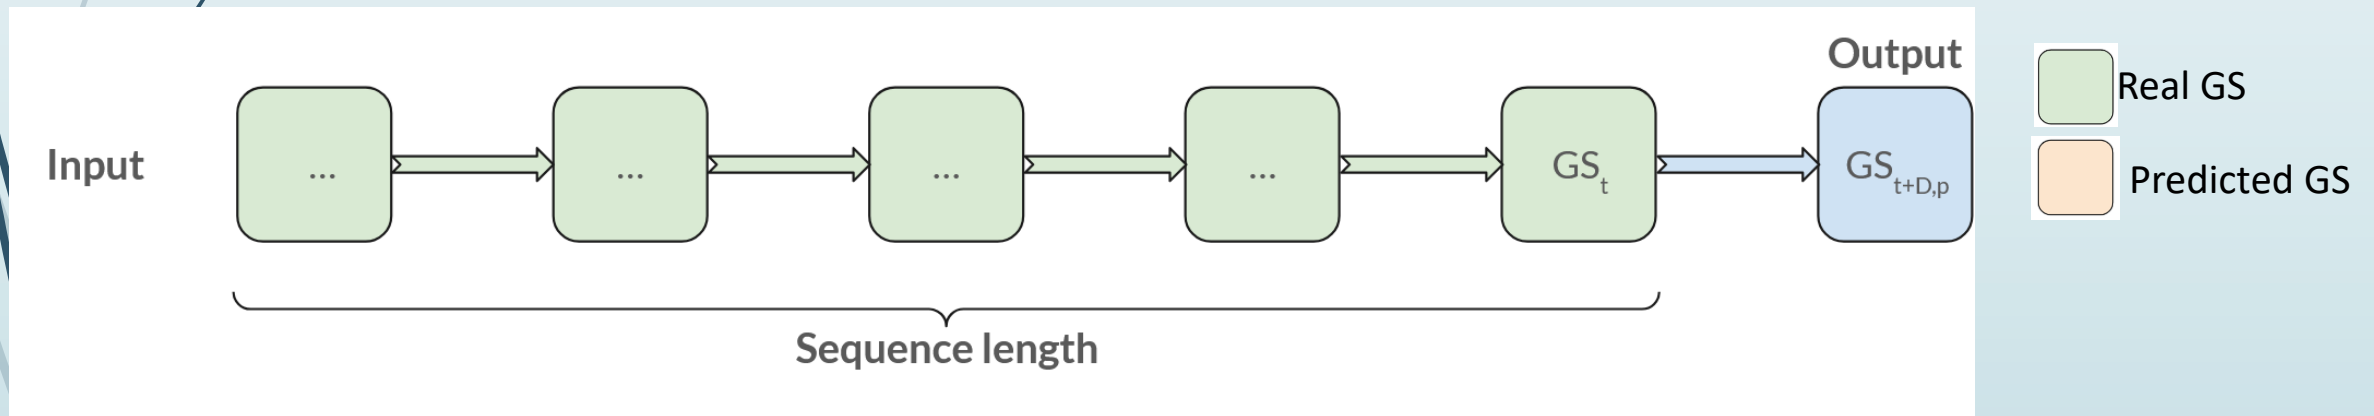

## Guideline

- Implement the SPG predictions in the game
- Two possible issues:
  - Prediction **accuracy** (MAE) different between **training** and **game**
  - **Error Accumulation** -> when the input vector contains predicted data

# SPG MDL - (7-8) Implement and Evaluate SPG

## Guideline

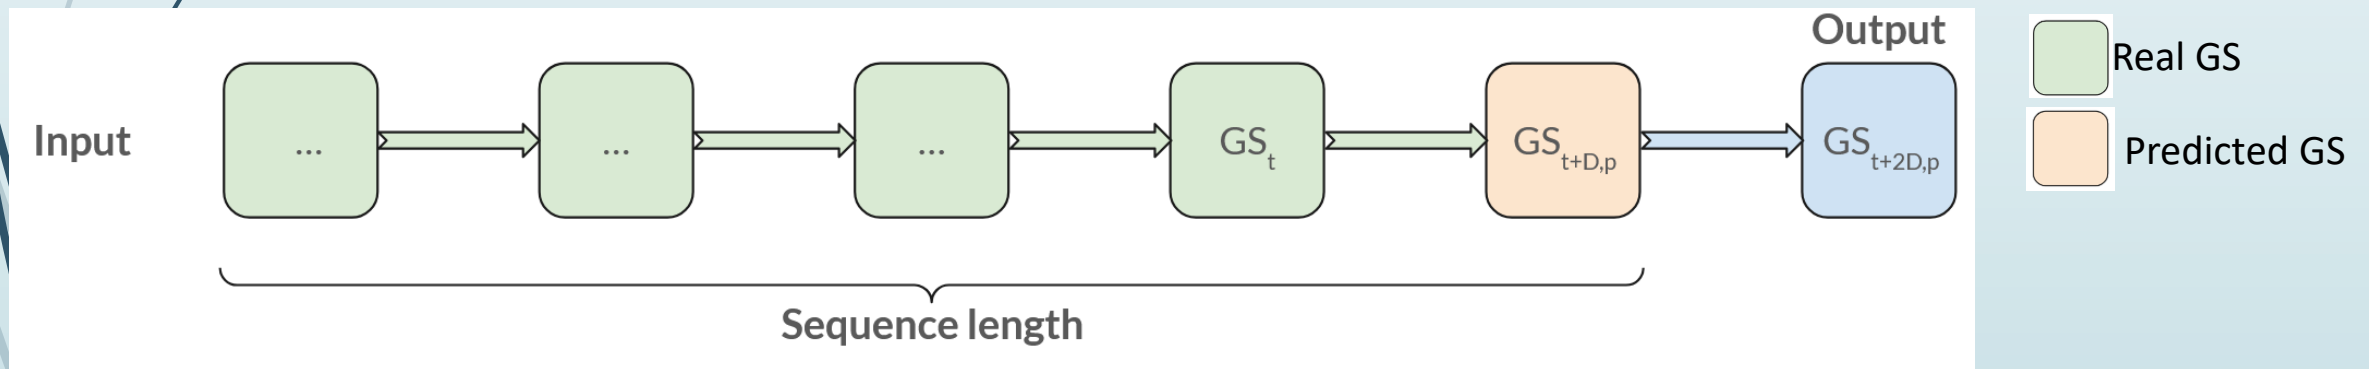

- Implement the SPG predictions in the game
- Two possible issues:
  - Prediction **accuracy** (MAE) different between **training** and **game**
  - **Error Accumulation** -> when the input vector contains predicted data

# SPG MDL - (7-8) Implement and Evaluate SPG

## Guideline

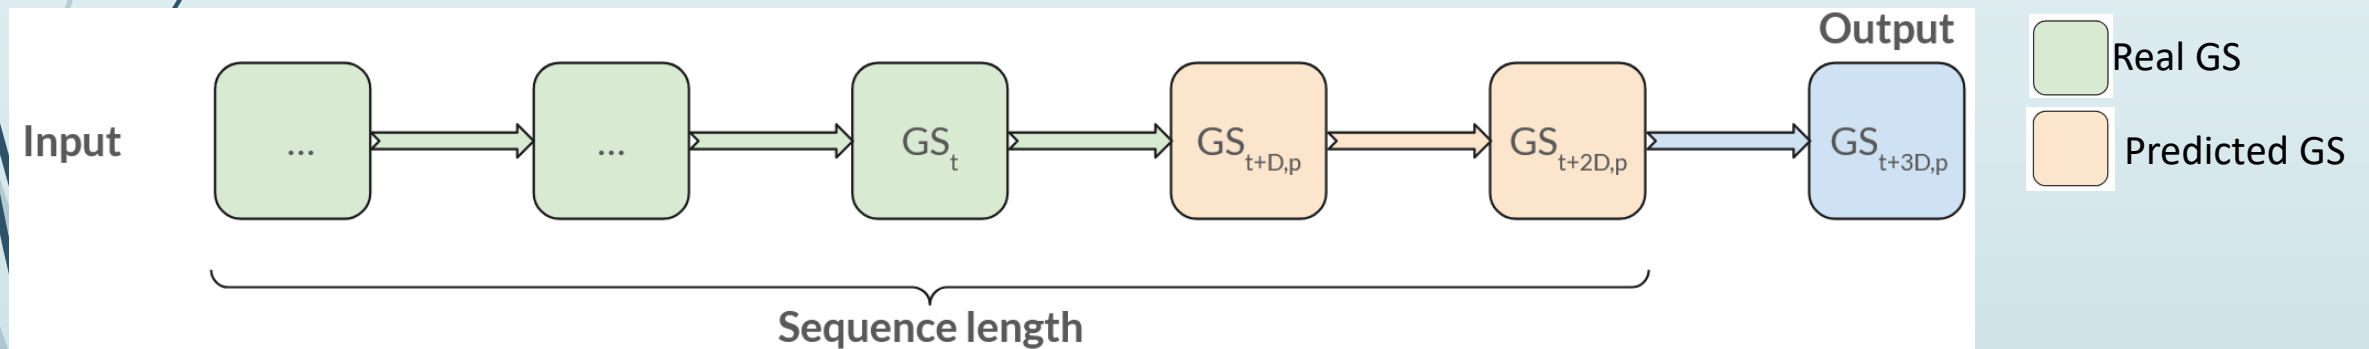

- Implement the SPG predictions in the game
- Two possible issues:
  - Prediction **accuracy** (MAE) different between **training** and **game**
  - **Error Accumulation** -> when the input vector contains predicted data

# SPG MDL - (7-8) Implement and Evaluate SPG

## Guideline

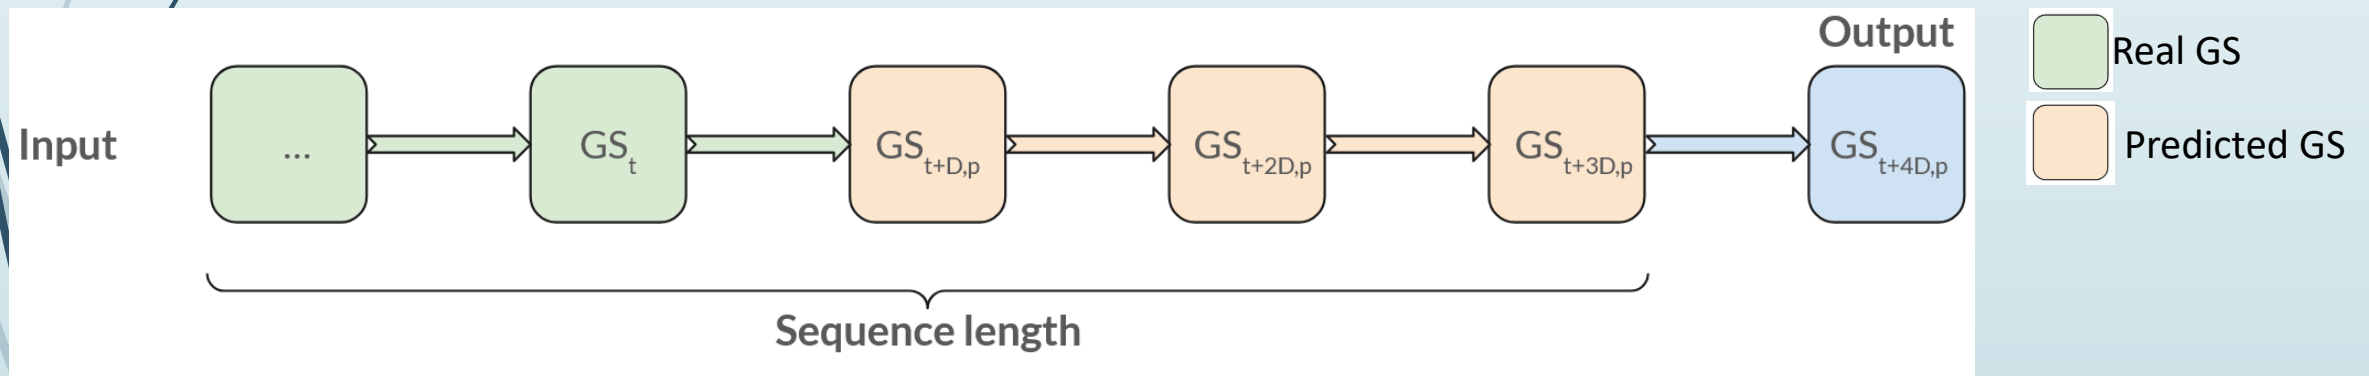

- Implement the SPG predictions in the game
- Two possible issues:
  - Prediction **accuracy** (MAE) different between **training** and **game**
  - **Error Accumulation** -> when the input vector contains predicted data

# SPG MDL - (7-8) Implement and Evaluate SPG

## Guideline

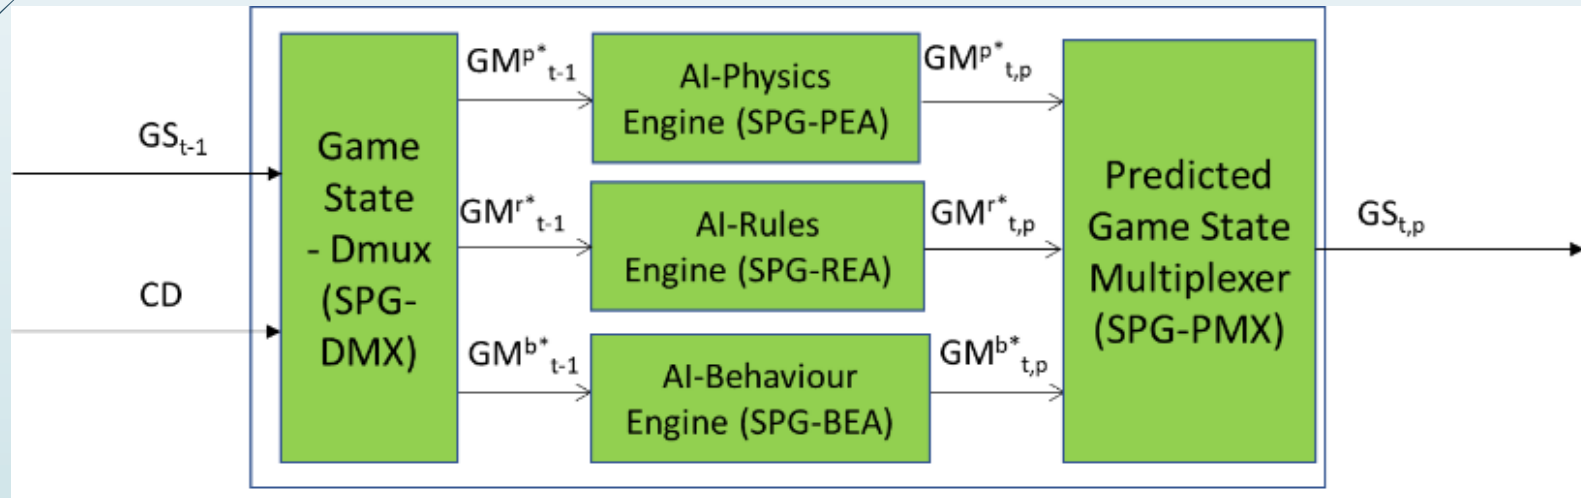

- Implement the SPG predictions in the game
- Two possible issues:
  - Prediction **accuracy** (MAE) different between **training** and **game**
  - **Error Accumulation** -> when the input vector contains predicted data

# SPG MDL - (7-8) Implement and Evaluate SPG

## Car Racing Game

- Implemented the Behaviour Engine AI

# SPG MDL - (7-8) Implement and Evaluate SPG

## Car Racing Game

- Implemented the Behaviour Engine AI
- Computed MAE for all 4 model from the pool
- Assessed the degree of Error Accumulation

# SPG MDL - (7-8) Implement and Evaluate SPG

## Car Racing Game

- Implemented the Behaviour Engine AI
- Computed MAE for all 4 model from the pool
- Assessed the degree of Error Accumulation

SPG predictions

AI-Driver

# SPG MDL - (7-8) Implement and Evaluate SPG

## Car Racing Game

- Implemented the Behaviour Engine AI
- Computed MAE for all 4 model from the pool
- Assessed the degree of Error Accumulation

# SPG MDL - (7-8) Implement and Evaluate SPG

## Car Racing Game

- Implemented the Behaviour Engine AI
- Computed MAE for all 4 model from the pool
- Assessed the degree of Error Accumulation

# SPG MDL - (7-8) Implement and Evaluate SPG

## Car Racing Game

- Implemented the Behaviour Engine AI
- Computed MAE for all 4 model from the pool
- Assessed the degree of Error Accumulation

# SPG MDL - (9) Simulate Disturbance

## Guideline

- ▶ Simulate SPG working environment: missing/delayed data due to network issues
- ▶ Disturbance simulation:
  - ▶ Application Level
  - ▶ Network Level

# SPG MDL - (9) Simulate Disturbance

## Car Racing Game

- Disturbance simulated at the **Application Level**
- Implementation of a **Discard Module**
  - **Length**
  - **Interval**

DL	Length (s)	Interval (s)
DL1	0	0
DL2	0.3	10 +/- 2
DL3	0.6	8 +/- 2

# SPG MDL - (10) Evaluate Game Experience

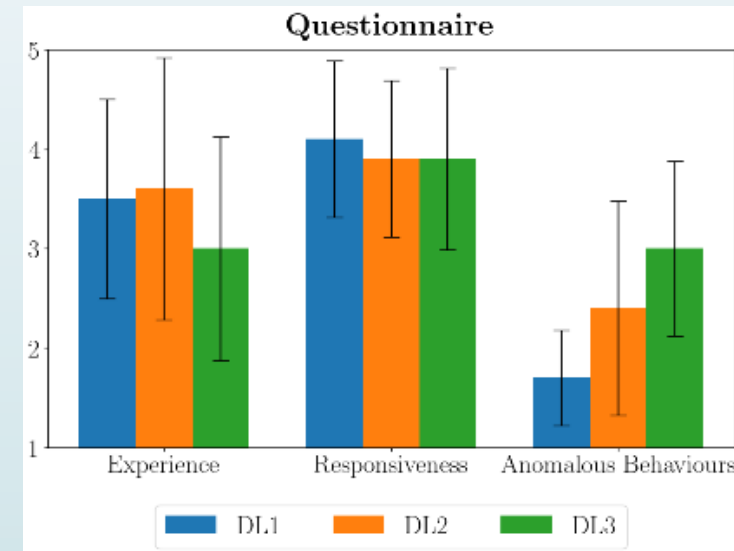

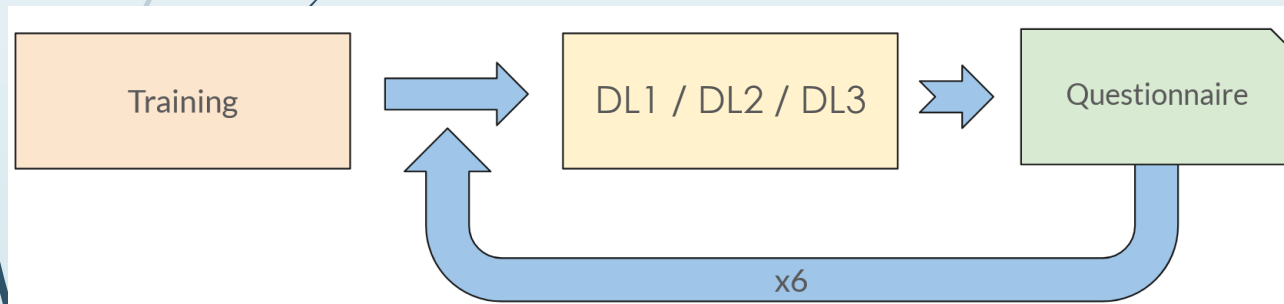

## Guideline

- Perform a user study (with Human Players) under 2 conditions:
  - (1) **no network disturbance**
  - (2) **simulated disturbance** with SPG active to **compensate**
- **Collect Qualitative Data addressing:**
  - Perception of anomalous behaviors
  - Game responsiveness
  - Overall gaming experience

# SPG MDL - (10) Evaluate Game Experience

## Car Racing Game

- Conducted a user study involving 12 participants

# SPG MDL – Future Works

- ▶ Test different models -> for example diffusion models instead of LSTM
- ▶ Extensive testing with real players
- ▶ Real player data collection -> for a refined dataset
- ▶ Instead of game state prediction, use AI agents as forecasters to take over when data is missing

# SPG MDL - Thanks to
